# NEXT-TIME QUESTION

The broom balances at its center of gravity. If you saw the broom into two parts through the center of gravity and then weight each part on a scale, which part will weigh more?

Answer:

The short broom part is heavier. It balances the long handle just as kids of unequal weights can balance on a seesaw when the heavier kid sits closer to the fulcrum. Both the balanced broom and seesaw are evidence of equal and opposite torques —not equal weights.
